Descriptive Analytics Report

Myntra Online Fashion and Lifestyle

A Best-Selling Categories, Satisfaction Ratings, Ratings vs Order Value, Customer vs Delivery Experience, Price Analysis, Value-for-Money, Engagement Density, Category Breadth, Price Positioning, Rating Alignment, Payment Pricing, Delivery Review

Note on data: This report uses a 300-record Myntra Online Fashion and Lifestyle dataset covering transactions across 6 cities and 8 product categories during January-March 2026. The dataset includes customer ratings, delivery ratings, order values, product categories, payment methods, membership status, discount information, return status, reorder status, age groups, and sale indicators. It is used to perform descriptive analytics and identify patterns in customer satisfaction, category popularity, order value, repeat-order behavior, and delivery experience during the study period. Since the Myntra dataset does not contain Zomato-style menu-item votes or individual SKU-level engagement counts, the engagement analysis below uses transaction volume and reorder rate as available behavioral measures.

Objective:

Build a descriptive analytics layer over Myntra Online Fashion and Lifestyle.

1. Which product categories receive the highest customer satisfaction ratings?
2. Which product categories are the most popular by transaction volume?
3. Is there a relationship between customer rating and order value?
4. Where does customer experience differ from delivery experience?
5. How does order value vary across product categories?
6. Which category offers the best value-for-money signal?
7. Which category generates the strongest repeat-order engagement?
8. Which category has the broadest representation in the sample?
9. Which category is positioned as premium vs budget?
10. Which category keeps customer and delivery ratings most closely aligned?
11. Which payment method is associated with the highest order-value level?
12. Which category would benefit most from a delivery-service review?

How This Would Work at Real Scale

At production scale, the same pipeline could process millions of Myntra transactions across cities, categories and customer segments.

Layer	Purpose	Typical tools
Investigation	Understand fields, coverage, missing values and data quality	Pandas
Cleaning & Standardization	Normalize category, city, payment and membership labels	Pandas, Jupyter Notebook
Aggregation	Rollup transactions into category, city, payment and monthly metrics	Pandas, Python
Analysis	Compute ratings, gaps, correlations, pricing and reorder measures	Pandas, Python
Visualization / Reporting	Publish rankings, trends and management insights	Matplotlib, Jupyter

The report uses the available Myntra columns rather than inventing product-level fields.

Data Dictionary & Scope

The source contains order ID, date/month, city, product category, age group, payment method, membership status, order value, delivery rating, discount flag/amount, customer rating, return flag, reorder flag and sale flag.

Field	Use in analysis
Order_ID	Unique transaction identifier; used to count the 300 records
Date / Month	Time coverage and monthly grouping
City	Geographic comparison
Product Category	Primary category-level segmentation
Age Group	Customer-segment context
Payment Method	Payment pricing comparison
Myntra Membership	Member vs non-member context
Order Value	Pricing, value-for-money and correlation analysis
Delivery Rating	Delivery experience measure
Discount / Discount Amount	Promotion context
Customer Rating	Customer satisfaction measure
Return	Return behavior context
Reorder	Repeat-purchase engagement measure
Sale	Sale-period context

Customer Satisfaction: Customer vs Delivery

Objective: Which product categories receive the highest satisfaction ratings?

Method: Average the Customer Rating and Delivery Rating for each category and compare them side by side.

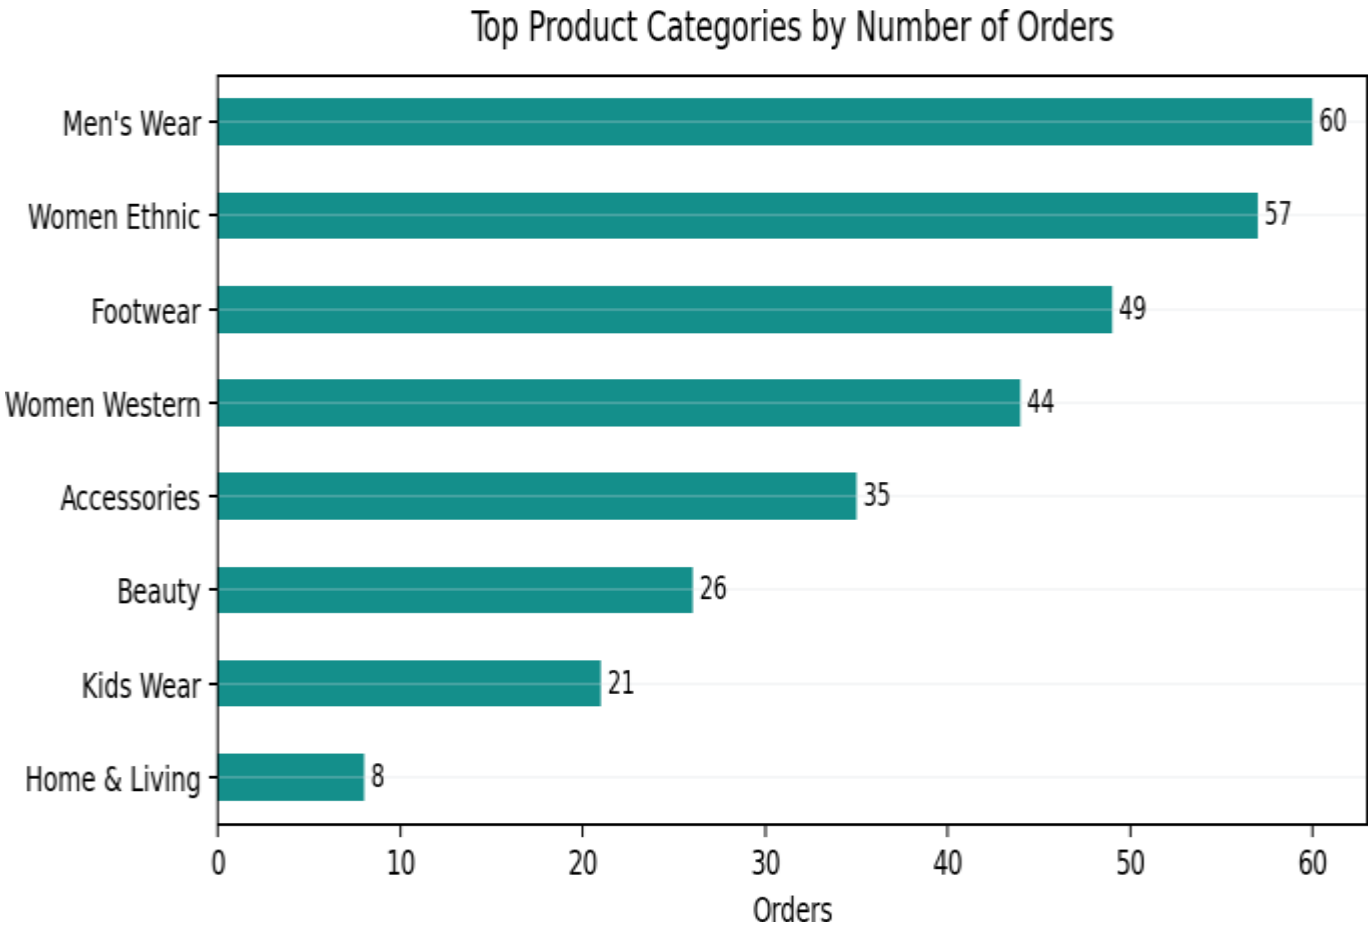

INSIGHTS : Beauty leads customer satisfaction at 4.46/5. Accessories leads delivery satisfaction at 4.98/5. The two leaders differ, showing that customer satisfaction and delivery performance should be monitored separately.

Popular Product Categories

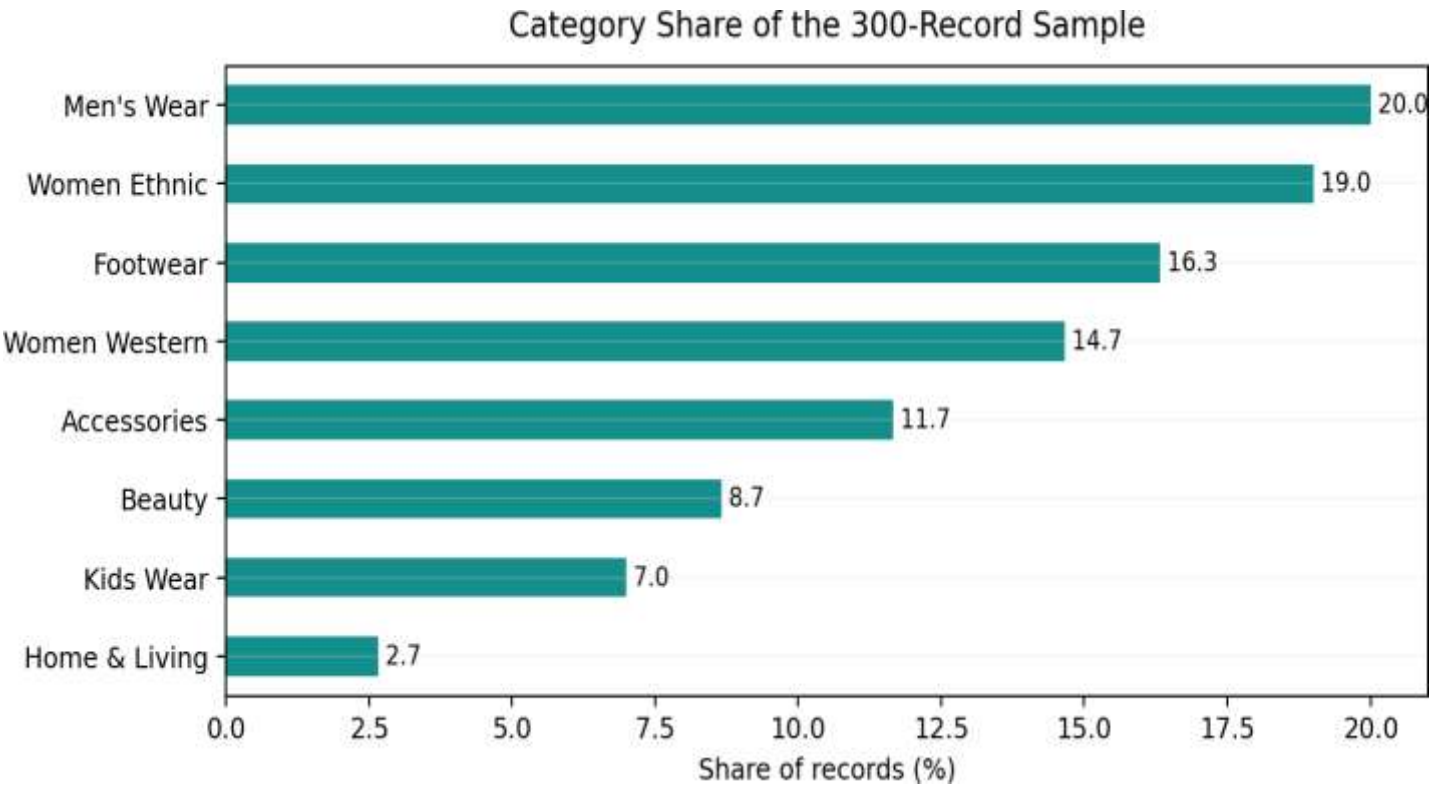

Objective: Which categories are most popular in the record sample?

Method: Rank categories by transaction/record count, then show each category's share of the sample.

INSIGHTS : Men's Wear is the most represented category with 60 records, or 20.0% of the sample. This indicates stronger transaction presence, not necessarily stronger customer preference at SKU level.

Category Share — Supporting View

INSIGHTS : Men's Wear represents 20.0% of the sample; the smallest category represents 2.7%.

Customer Ratings vs Order Value

Objective: Is there a relationship between customer rating and order value?

Method: Plot every transaction's order value against its customer rating and calculate Pearson correlation.

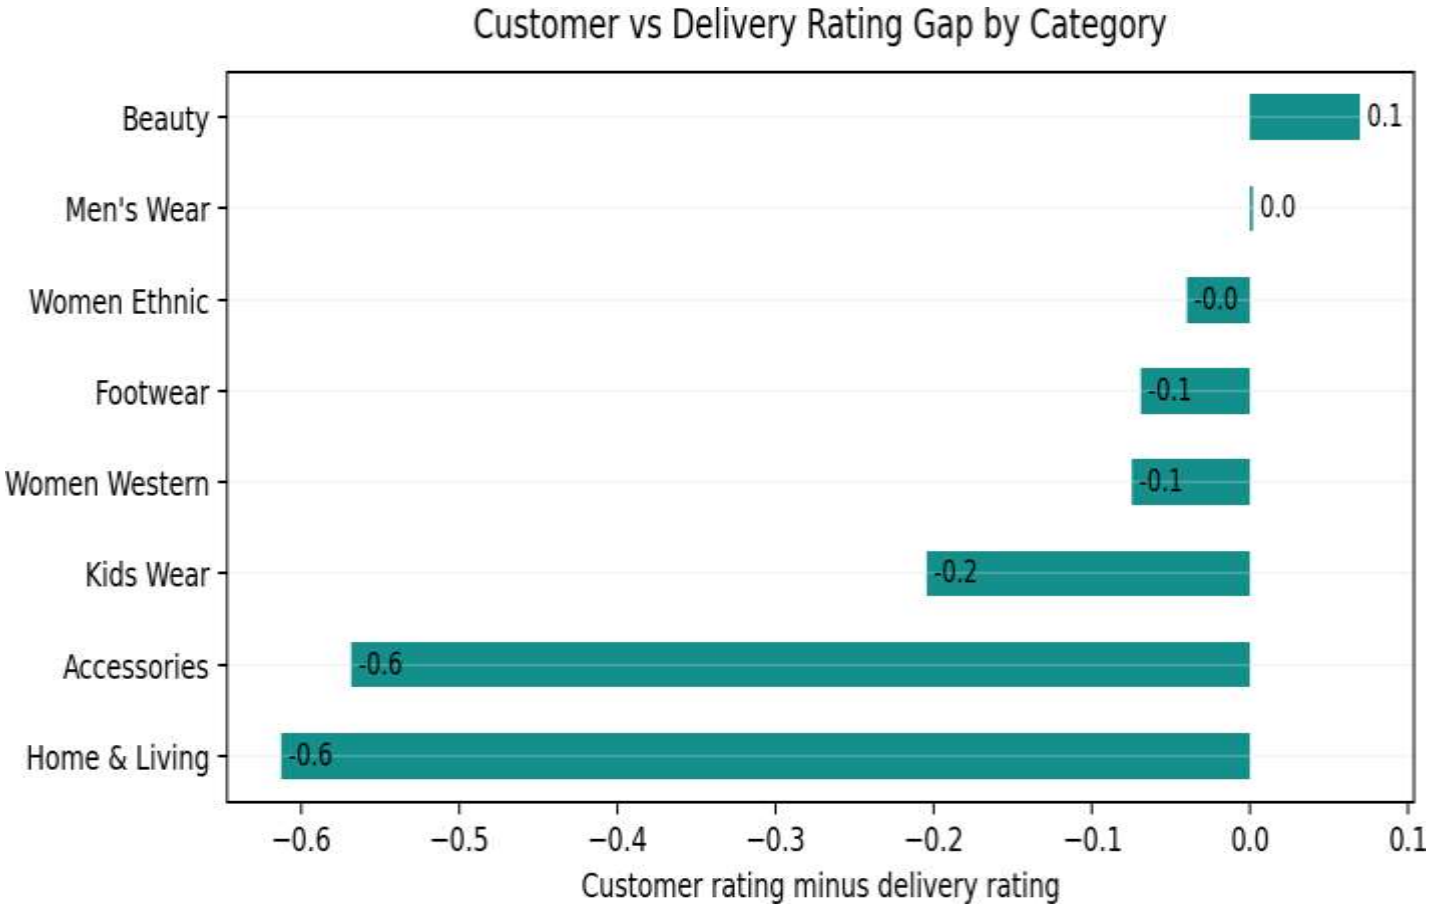

INSIGHTS : The correlation is -0.06, indicating a very weak relationship in this 300-record sample. Higher-value purchases are therefore not, by themselves, a reliable explanation for higher customer ratings.

Customer vs Delivery Experience Gap

Objective: Where does customer experience differ most from delivery experience?

Method: Subtract delivery rating from customer rating for each category. Positive values mean customer rating is higher; negative values mean delivery rating is higher.

INSIGHTS : Home & Living has the largest absolute gap at -0.61, while Men's Wear is the most closely aligned at an absolute gap of 0.00.

Order Value Analysis

Objective: How does order value vary across product categories?

Method: Compare mean transaction value by product category.

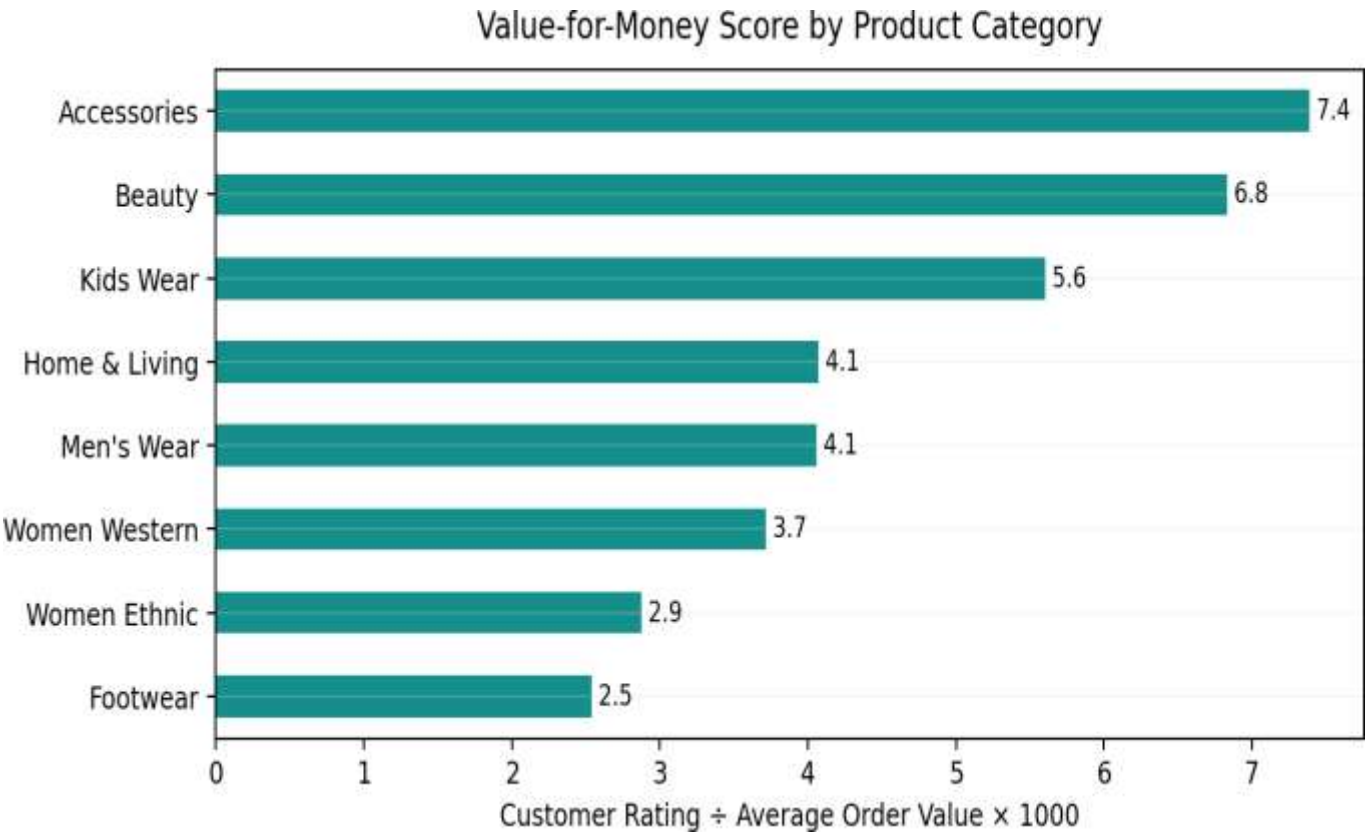

INSIGHTS : Footwear has the highest average order value at ₹1,734; Accessories is lowest at ₹597.

Value-for-Money Score

Objective: Which category offers the strongest value-for-money signal?

Method: Adapt the Zomato value-for-money idea to available Myntra data:
Customer Rating ÷ Average Order Value × 1,000.

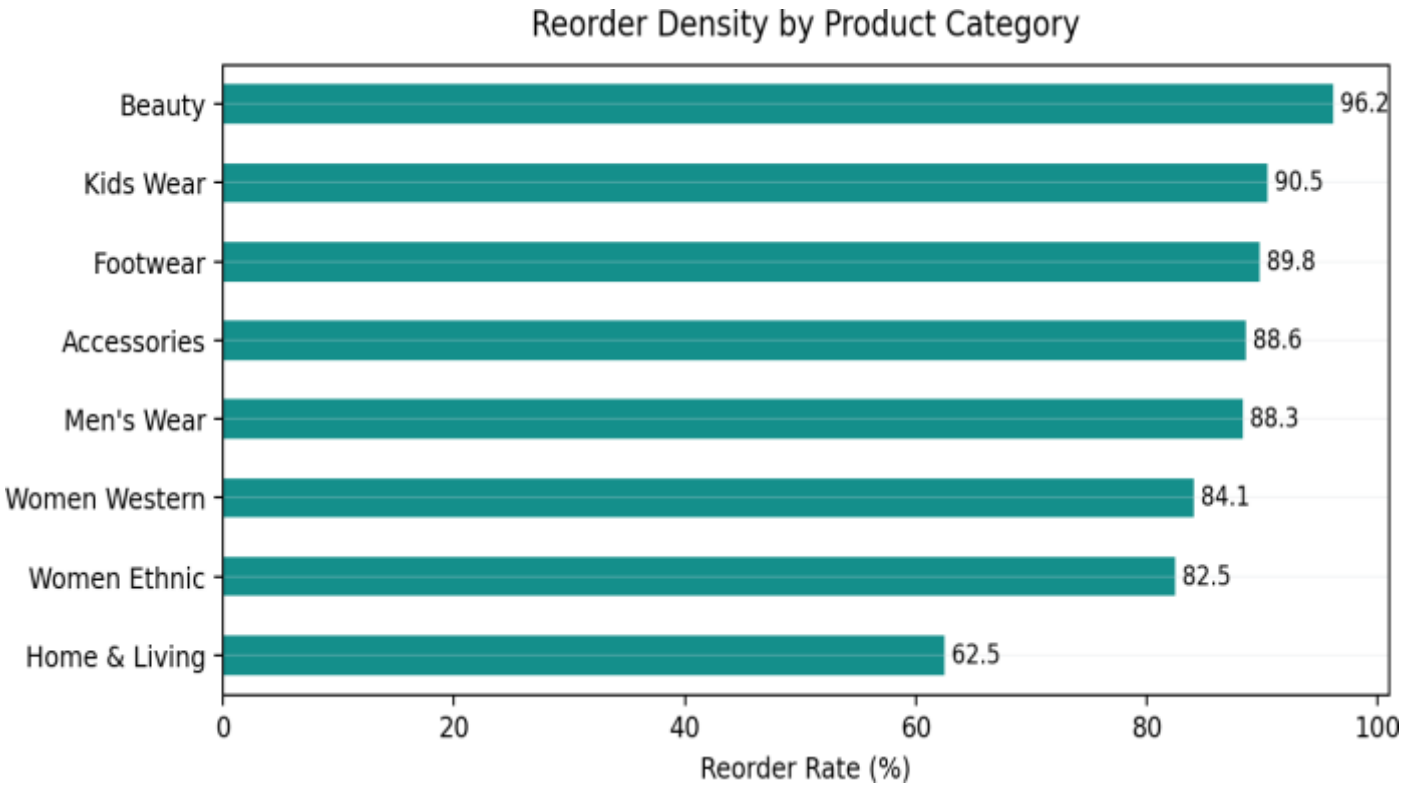

INSIGHTS : Accessories leads at 7.39. This is a comparative index, not a financial measure; a higher score means stronger rating relative to typical order value.

Reorder Density / Repeat Engagement

Objective: Which category generates the strongest repeat-order engagement?

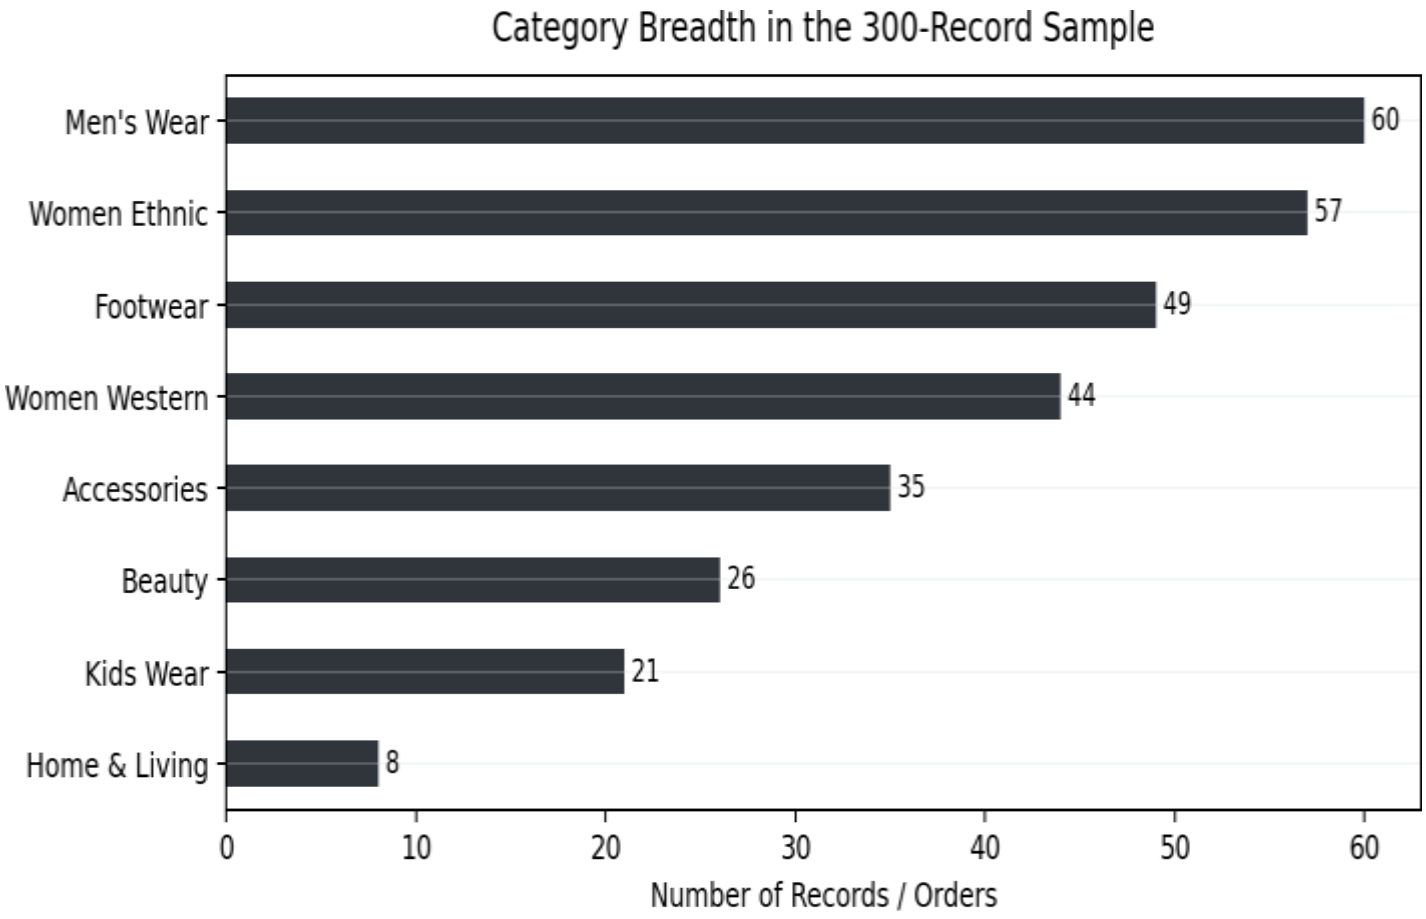

Method: Use the Reorder flag to calculate the percentage of transactions marked Yes in each category.

INSIGHTS : Beauty has the highest reorder rate at 96.2%, while Home & Living is lowest at 62.5%. This replaces Zomato's votes-per-item metric because Myntra has an explicit reorder field but no menu-item vote field.

Category Breadth

Objective: Which category has the broadest representation in this sample? Method: Count transaction records by product category.

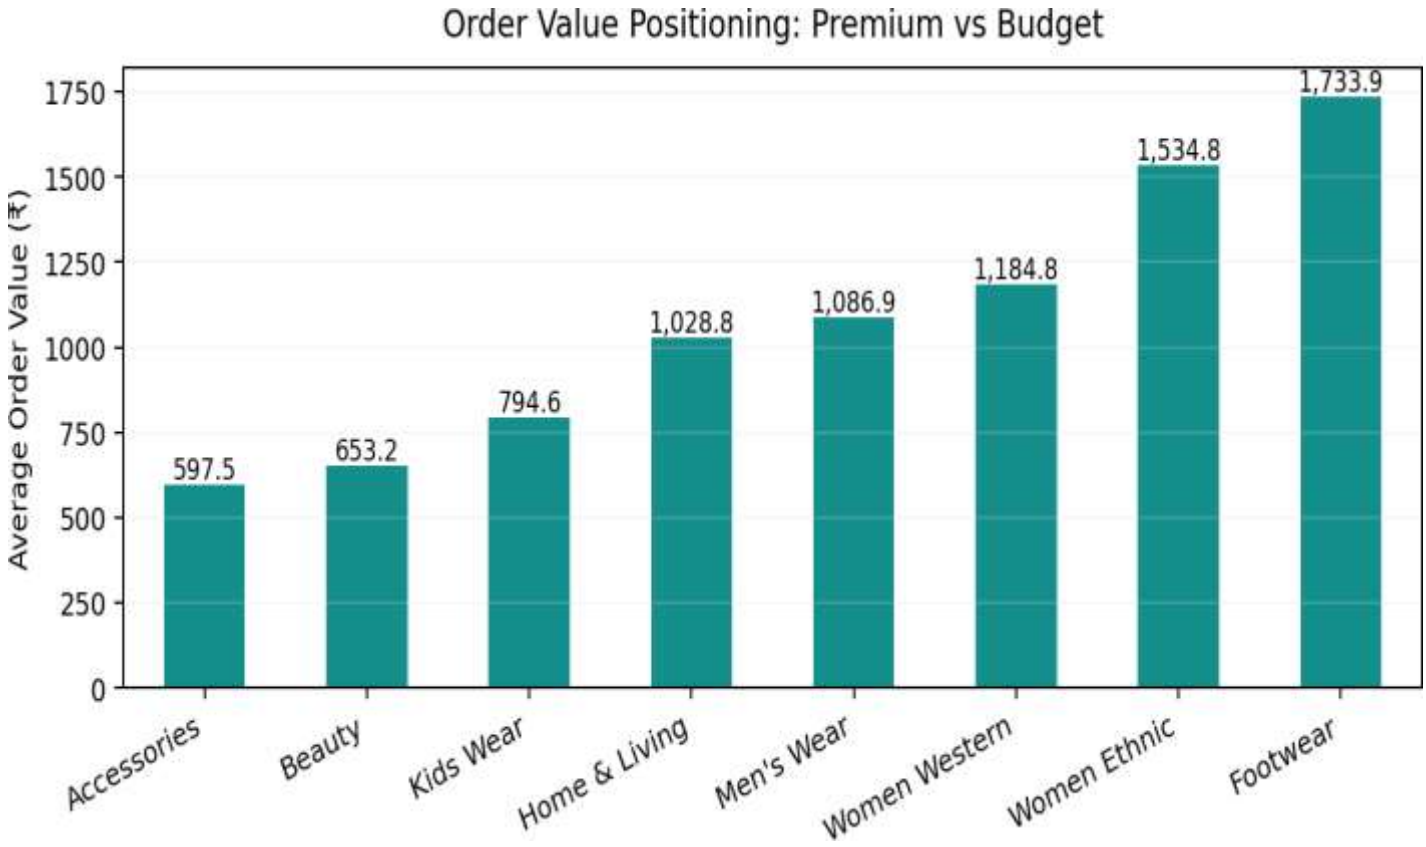

INSIGHTS : Men's Wear has the broadest representation with 60 of 300 records. This measures sample breadth, not the total size of Myntra's real catalog.

Price Positioning: Premium vs Budget

Objective: Which category is positioned as premium versus budget?

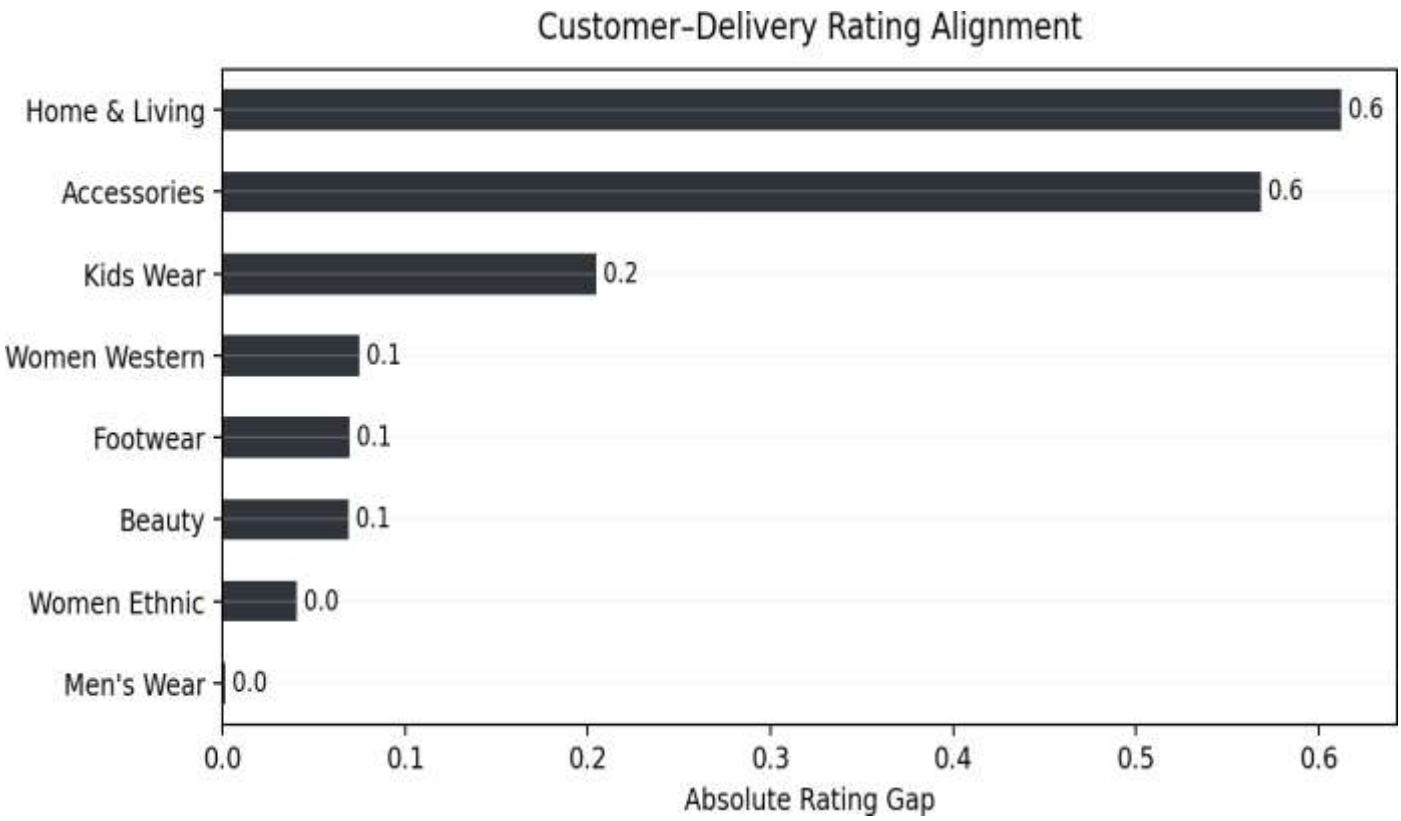

Method: Reuse category-level average order value to isolate the two ends of the price spectrum.

INSIGHTS : Footwear is the premium end at about ₹1,734 per order, while Accessories is the budget end at about ₹597.

Customer–Delivery Rating Alignment

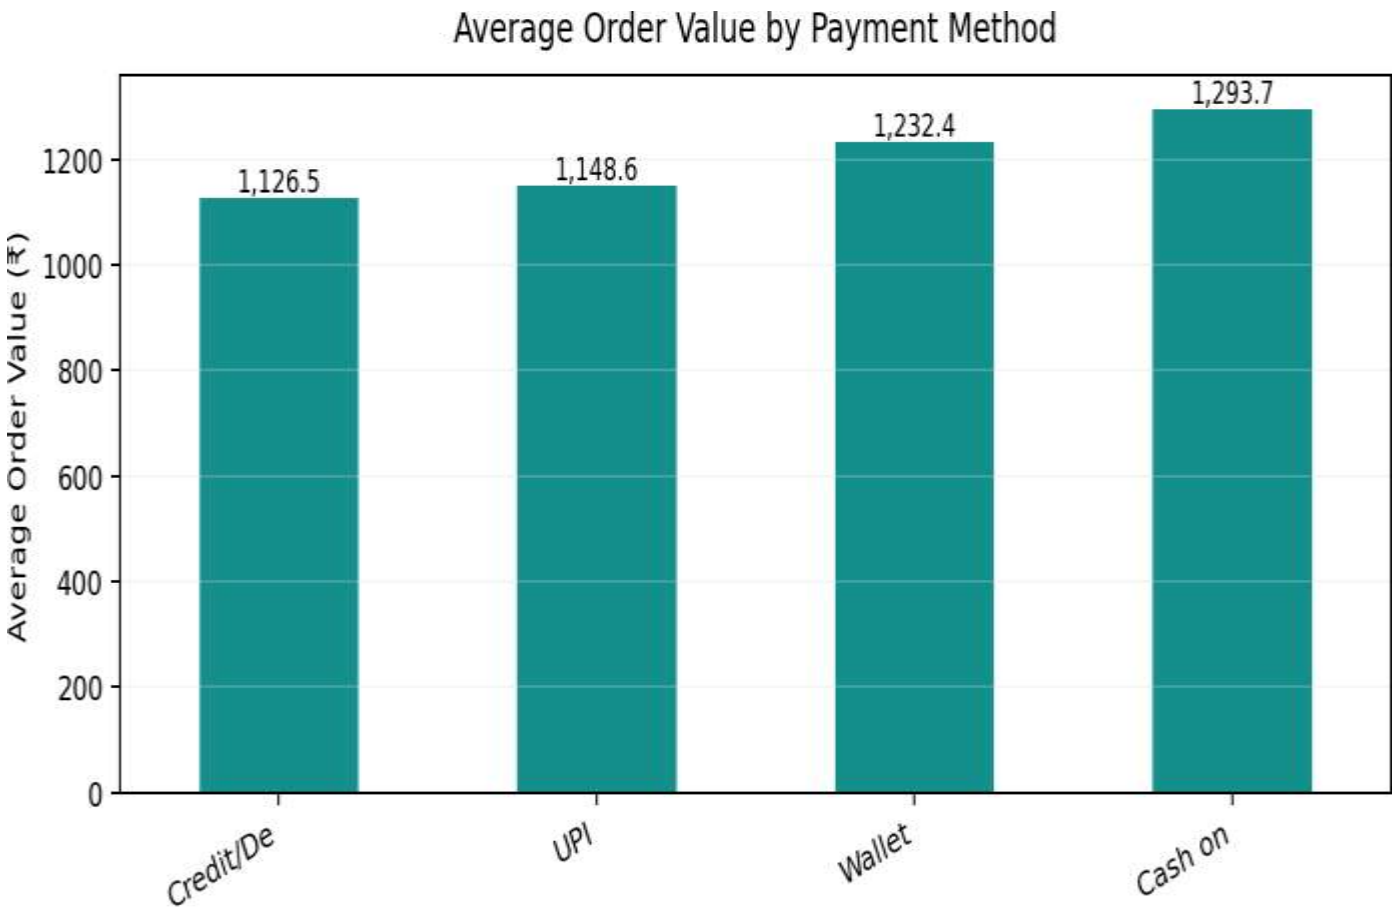

Objective: Which category keeps customer and delivery experience most closely aligned? Method: Compare the absolute value of the customer-rating minus delivery-rating gap.

INSIGHTS : Men's Wear has the closest alignment, with an absolute gap of 0.00. Home & Living has the widest divergence at 0.61.

Payment Method Pricing Premium

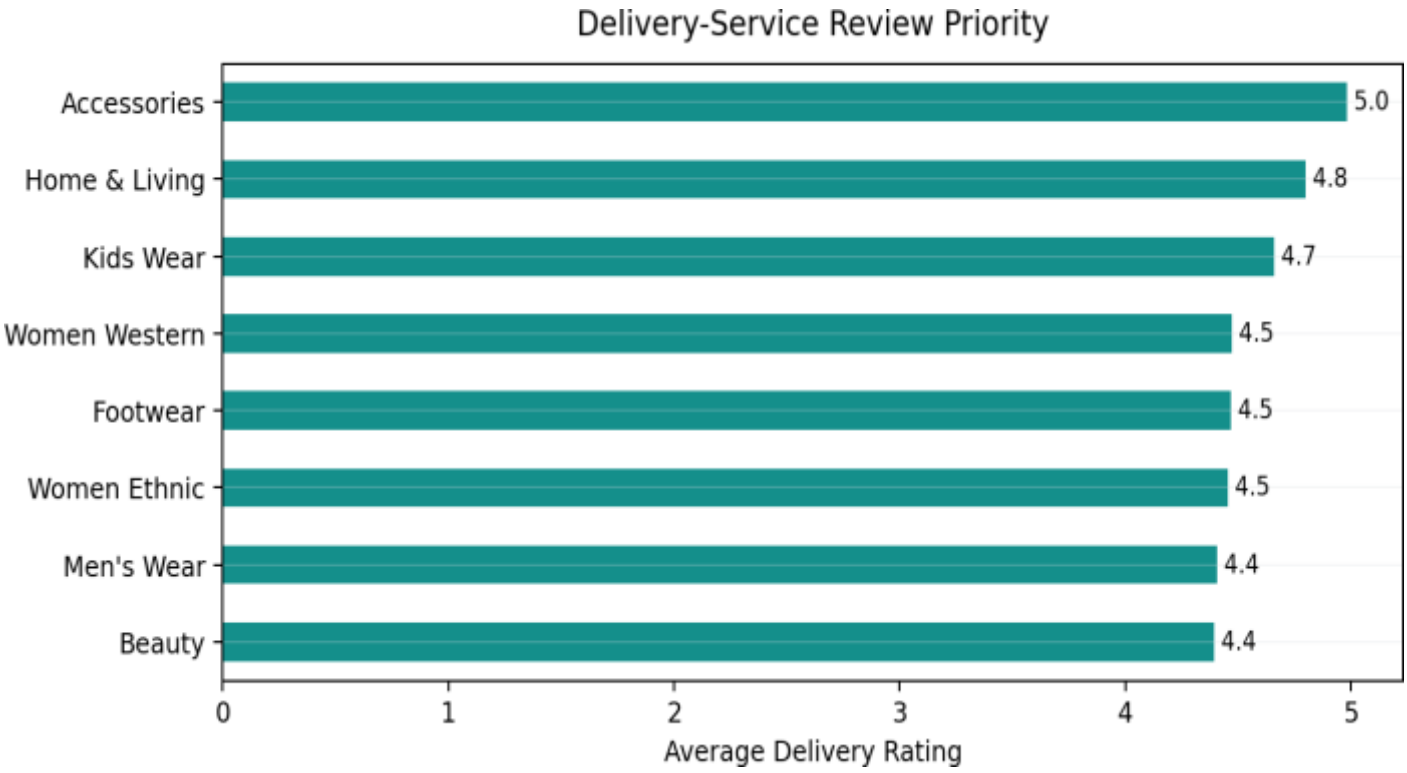

Objective: Which payment method is associated with the highest order-value level? Method: Group transactions by payment method and compare average order value.

INSIGHTS : Cash on has the highest average order value at ₹1,294. This is an association in the sample, not evidence that the payment method causes higher spending.

Delivery-Service Review Priority

Objective: Which category would benefit most from a delivery-service review? Method: Rank categories by average delivery rating and prioritize the lowest rating.

INSIGHTS : Beauty has the lowest average delivery rating at 4.39/5, making it the clearest category-level candidate for delivery-service investigation.

Summary of Key Metrics

The following KPI table consolidates the main results from the record analysis.

Metric	Result
Records analyzed	300
Cities covered	6
Product categories	8
Average customer rating	4.41 / 5
Average delivery rating	4.53 / 5
Top customer-rated category	Beauty – 4.46
Top delivery-rated category	Accessories – 4.98
Rating-order-value correlation	-0.06
Highest-order category	Men's Wear – 60
Highest average order value	Footwear – ₹1,734
Best adapted value-for-money	Accessories – 7.39
Highest reorder rate	Beauty – 96.2%
Lowest delivery rating	Beauty – 4.39

Category-Level KPI Table

A complete category-level view used to support the report's twelve objectives.

Category	Records	Avg Order ₹	Cust. Rating	Delivery	Reorder %
Men's Wear	60	1,087	4.41	4.41	88.3%
Women Ethnic	57	1,535	4.41	4.45	82.5%
Footwear	49	1,734	4.40	4.47	89.8%
Women Western	44	1,185	4.40	4.47	84.1%
Accessories	35	597	4.41	4.98	88.6%
Beauty	26	653	4.46	4.39	96.2%
Kids Wear	21	795	4.45	4.66	90.5%
Home & Living	8	1,029	4.19	4.80	62.5%

Payment and City KPI Tables

Payment method comparison:

Payment	Records	Avg Order ₹	Cust. Rating	Delivery
Cash on	46	1,294	4.36	4.43
Wallet	39	1,232	4.37	4.46
UPI	128	1,149	4.40	4.63
Credit/De	87	1,126	4.47	4.47

City Comparison:

City	Records	Avg Order ₹	Cust. Rating	Delivery
Mumbai	65	1,292	4.33	4.54
Delhi	62	1,099	4.45	4.23
Pune	45	1,198	4.33	4.50
Bengalur	45	1,301	4.47	4.51
Hyderaba	43	1,048	4.56	4.67
Chennai	40	1,075	4.33	4.89

16. Next Steps: Descriptive → Predictive

This report answers what happened in the supplied 300-record sample. The natural next layer is to move toward prediction and decision support.

1. Return prediction: model return probability using category, order value, discount, age group, city and membership.
2. Reorder prediction: identify patterns associated with repeat purchases.
3. Delivery-risk analysis: investigate categories and cities with lower delivery ratings.
4. Promotion analysis: compare discounted and non-discounted orders for value and ratings.
5. Membership analysis: compare members and non-members on spending, ratings and reordering.
6. Customer segmentation: combine age group, city, order value and reorder behavior.
7. Time-series expansion: continue the pipeline across more months.
8. Product/SKU enrichment: add product names, views, clicks, wishlist activity and return reasons for true item-level engagement.

The 300-record Myntra sample shows strong overall ratings, meaningful differences between customer and delivery experience, clear category-level order-value differences and substantial variation in reorder behavior. The strongest opportunity is to connect these descriptive patterns with returns, promotions, membership and product-level behavior in a larger dataset.
